growth human New human monoclonal antibody that binds to platelet-derived factor-D (PDGF-D), useful for treating chronic and recurrent diseases, such as inflammation, autoimmunity and cancer.

Disclosure; SEQ ID NO 255; 255pp; English

The invention relates to a human monoclonal antibody that binds to platelet-derived growth factor-D (PDGF-D). The antibodies are useful for treating chronic and recurrent human diseases, such as inflammation, autoimmunity and cancer. The PDGF-D nucleic acids and polypeptides are useful for modulating collagen formation, and for staging various cancers. Antibodies to platelet-derived growth factor-D (PDGF-D) were generated using an active protein fragment of the gene product from the clone 30664188.0.99 arising in the conditioned medium obtained when HEX293 cells are transfected with the plasmid pCBP4/Sec-30664188. This sequence corresponds to a protein used in the invention.

The invention relates to a human monoclonal antibody that binds to platelet-derived growth factor-D (PDGF-D). The antibodies are useful for treating chronic and recurrent human diseases, such as inflammation, autoimmunity and cancer. The PDGF-D nucleic acids and polypeptides are useful for modulating collagen formation, and for staging various cancers. Antibodies to platelet-derived growth factor-D (PDGF-D) were generated using an active protein fragment of the gene product from the clone 30664188.0.99 arising in the conditioned medium obtained when HEK293 cells are transfected with the plasmid pCBP4/Sec-30664188. This sequence corresponds to a protein used in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an antibody or its binding fragment that binds platelet derived growth factor-DD (PDGF-DD), where the antibody is useful in preparing a medicament for treating rephritis. Also described: (1) a method of detecting nephritis; (2) a method of treating nephritis; (3) a method of inhibiting mesangial cell proliferation; and (4) a method of treating mesangial proliferative glomerulonephritis. The antibody has nephrotropic, antiinflammatory, dermatological, immunosuppressive and antidiabetic activities, and can be used in gene therapy. The antibody or its binding fragment, that binds PDGF-DD, can be used in preparing a medicament for treating nephritis and related disorders, e.g., mesangial proliferative glomerulonephritis. The present sequence represents a human monoclonal antibody (mAb) variable region sequence, which is used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a human monoclonal antibody that binds to platelet-derived growth factor-D (PDGF-D). The antibodies are useful for treating chronic and recurrent human diseases, such as inflammation, autoimmunity and cancer. The PDGF-D nucleic acids and polypeptides are useful for modulating collagen formation, and for staging various cancers. Antibodies to platelet-derived growth factor-D (PDGF-D) were generated using an active protein fragment of the gene product from the close 30664188e, 0.99 arising in the conditioned medium obtained when HEK293 cells are transfected with the plasmid pCEP4/Sec-30664188. This sequence corresponds to a protein used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 DIVWIQSPLSLPVIPGEPASISCRSSQSLLHSNGYNYLDWYLQKPGQSPQLLIYLGSNRA

The invention provides a human erythroid differentiation related factor (hEDRF). The hEDRF polypeptide and the encoding polymucleotide are useful for treating anemias and other erythrocyte deficiencies. The hEDRF protein is useful for producing antibodies, useful in screening assays to identify pharmaceutical compounds of interest and compounds which bind to hEDRF. The polymucleotides are useful for producing hEDRF or its related polypeptides. The antibodies are useful for separating or detecting the corresponding antigen e.g. for detection/quantitation of hEDRF in samples taken from human subjects. Quantification of hEDRF at immunohistochemical level finds value in evaluating the potential of the tissue site to contribute towards the production of new erythroid cells. The present sequence represents the amino acid sequence of an anti-hEDRF antibody e9
                                                                                               Novel human erythroid differentiation related factor and polynucleotides encoding it useful for treating anemia and other erythrocyte deficiencies and for detecting expression of the factor in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 DIVWTQSPLSLPVTPGEPASISCRSSQSLLHSNGYNYLDWYLQKPGQSPQLLIYLGSNRA

the present sequence is that of the light chain variable region (VI) of human single chain antibody (scFv) HID-5, which is directed against contained globorotein 1b (GPID). The HID series of EcFv was isolated from a human synthetic VH and VL scFv library by 3 rounds of phagemid a human synthetic VH and VL scFv library by 3 rounds of phagemid component of the GPID/IX/V complex on their surface, followed by a 4th component of the GPID/IX/V complex on their surface, followed by a 4th cround of selection against washed thuman platelets, and 2 final rounds in which attempts were made to displace scFv from washed platelets by complex of the GPID alpha and conclound antibody or mimotope peptide (see AAY95229). Whether displayed as surface proteins on a phagemid or secreted as free scFv by Bscherichia coli, the HID scFv clones are capable of inhibiting von Willebrand factor-dependent aggregation of platelets. The scFv are composed of native human protein sequences and are therefore attractive potential reagents for therapeutic purposes. They provide a new class of antithrombotic agents, useful for the crown for a large and an early and an an early sequence is grafts, dialysis etc., and can also be used as diagnostic reagents. Methods of inhibiting aggregation of platelets, of binding human platelet contained in the specification are claimed. Note: The present sequence is not shown in the specification are claimed. Note: The present sequence is given in Fig 8 (see AAY95220)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                      Isolated nucleic acid molecule encoding anti-human platelet glycoprotein
Ib alpha molecule useful for producing antibodies which inhibit platelet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Abzyme, antibody, immunoglobulin; infection, antimicrobial; cancer;
cytostatic; diagnostic; peptidase; light chain variable region; enzyme.

antibody with enzymatic activity using a primer based on a subgroup-
specific sequence. The antibody enzymes of the invention can be used in a
variety of fields, such as the medical industry, pharmaccutical industry,
reagent industry, medical equipment industry or food industry. The
antibody enzymes are useful in the diagnosis and treatment of medical
conditions such as cancer and various infectious dieesses, and can also
be used in biosensors and biomaterials. The antibody enzymes exhibit high
in vivo efficacy for therapeutic applications, and can be produced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a human antibody enzyme (abzyme) having high recognition ability and high enzyme activity. The antibody enzyme comprises a light chain encoded by a human germ line gene selected from Li22, VI-9, VI-13, VI-18, VI-22, V2-6, V2-7, V2-8, V2-13, V2-14, V3-3, A1, A2, A3, A5, A7, A10, A10, A17, A10, A19, A23, A26, A30, L14 and L22, and a heavy chain encoded by a human germ line gene selected from VH1-24, VH3-9, VH3-13, VH3-74, VH3-74, VH4-34 and VH7-81. The invention also relates to a method for producing a human antibody enzyme belonging to a particular subgroup involving selection of human lymphocyte cDNAs encoding an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     efficiently. The present sequence represents a specifically claimed V-kappa2 light chain variable region (VL) of a human antibody enzyme having
                                                                                                                                                                                                                                                                                                                                         New human enzyme antibody consisting of light chain or heavy chain polypeptides encoded by human germ line gene e.g. L22 and VH1-24, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     listing of the specification and differs from the sequence also referred to as VL pHVK-1 (ABJ57944) which is shown in Figure 18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peptidase activity. This sequence comprises a Ser-His-Asp (S-H-D) catalytic triad. Note: The present sequence is shown in the sequence
                                                                                                                                                                                                                                                                                                                                                                     peptides encoded by human germ line gene e.g. L22 and VH1-treatment and diagnosis of infectious diseases and cancer.

Example 3; Fig 18; 30pp; Japanese

The invention relates to a human antibody enzyme (abzyme) having high recognition ability and high enzyme activity. The antibody enzyme comprises a light chain encoded by a human germ line gene selected from 122, V1-9, V1-13, V1-18, V1-22, V2-6, V2-7, V2-8, V2-13, V2-13, V3-3, A1, A2, A3, A5, A7, A10, A17, A18, A19, A23, A26, A30, L14 and L22, and a heavy chain encoded by a human germ line gene selected from VH1-24, VH3-10, VH3-13, VH3-14, VH3-13, VH3-14, VH3-13, VH3-14, VH4-34 and VH7-81. The invention also relates to a method for producing a human antibody enzyme belonging to a particular subgroup involving selection of human lymphocyte cDNAs encoding an antibody with enzymatic activity unique primer based on a subgroup-specific sequence. The antibody enzymes of the invention can be used in article and a such as the medical industry, pharmaceutical industry, reagent industry, medical equipment industry or food industry. The cativity or fields, such as the medical industry or food industry. The cativity or fields and can also conditions such as cancer and various infectious diseases, and can also be used in biosensors and biomaterials. The antibody enzymes exhibit high in vivo efficiently. The present sequence represents a V-kappa2 light chain cativity. This sequence comprises a Ser-His-Asp (S-H-D) catalytic triad. Note: The present sequence also ser-His-Asp (S-H-D) catalytic triad. Note: The present sequence as Ser-His-Asp (S-H-D) catalytic fileds. Second of the sequence also referred to as VL pHVK-1 (ABJST801) which in the sequence and the sequence of the sequence and the se

Isolated nucleic acid molecule encoding anti-human platelet glycoprotein Ib alpha molecule useful for producing antibodies which inhibit platelet

Claim 18; Fig 8; 89pp; English.

The present sequence is that of the light chain variable region (VL) of human single chain antibody (scFv) HID-5, which is directed against controlled gloppotein in (GPID). The HID series of scFv was isolated from a human synthetic VH and VL scFv library by 3 rounds of phagemid a human synthetic VH and VL scFv library by 3 rounds of phagemid component of the GPID/IX/V complex on their surface, followed by a 4th crownd of selection against washed human platelets, and 2 final rounds in which mutine monoclonal antibody or minotope peptide (see ANY95229). Whether displayed as surface, from washed platelets by contract of secreted as free scFv by Escherichia coli, the HID scFv clones are secreted as free scFv by Escherichia coli, the HID scFv clones are capable of inhibiting von Willebrand factor-dependent aggregation of platelets. The scFv are composed of native human protein sequences and are therefore attractive potential reagents for therapeutic purposes. CF They provide a new class of antithrombotic agents, useful for the correction of platelet-dependent thrombi in diseased arteries, bypass constits, dialysis etc., and can also be used as diagnostic reagents.

Wethods of inhibiting aggregation of platelets, of binding human platelet constituted that the scFv and can also be used as diagnostic reagents. Methods of inhibiting aggregation of platelets, of binding human i GPIb alpha and of selecting a VH or VL region of an antibody that inhibits platelet aggregation are claimed

The present invention describes a method (M1) for identifying an antipody (I) in a mammal. The autoantibody is detected by platelet autoantibody [I] in a mammal. The autoantibody is detected by platelet autoantibody plated display library from 8-1 ymphocytes obtained from the mammal, and screening the library to detect a phage that crompared in a mammal having competitive cellocompities panning. Also described: (I) an autoantibody identified by (M1); (2) an isolated nucleic acid encoding an anti-platelet autoantibody; (3) inhibiting (M2) blood clotting in a mammal having a thrombus or at risk of thrombus formation; (4) reversibly (M3) inhibiting blood clotting in a mammal having a thrombus or at risk of thrombus formation; (5) inhibiting (M3) platelet adhesion in a mammal; (7) treating (M3) platelet adhesion in a mammal; (8) inhibiting (M3) platelet adhesion in a mammal; (7) treating (M3) platelet autoantibody in (II) inhibiting (M3) platelet autoantibody in (II) inhibiting (M3) platelet autoantibody with a platelet activation; (10) inhibiting (M3) platelet autoantibody with a platelet; (13) a peptide that inhibits binds with an anti-platelet autoantibody with a platelet; (13) a peptide that inhibits binds with an anti-platelet autoantibody with a platelet; (13) a peptide that inhibiting platelet function; (16) a kit for reversibly inhibiting blood clotting, inhibiting platelet aggregation, inhibiting platelet aggregation, inhibiting platelet aggregation, inhibiting platelet autoantibody, or its biologically active fragment that comprises an antigen binding region derived from an H414 anti-platelet autoantibody, the kit further comprising a peptide autoantibody, or its biologically active fragment comprises an antigen binding with allogical and an instructions for use. (I) has haemostatic, anticoagliant and an instruction for use. (I) has haemostatic, anticoagliant and
                                                                                                                                                                                                                                                                                                                                               thrombus, platelet adhesion inhibition,

The present sequence is that of the light chain variable region (VL) of human single chain antibody (scFv) HID-5, which is directed against platelet glycoprotein Ib (GPID). The HID series of scFv was isolated from a human synthetic VH and VL scFv library by 3 rounds of phagemid selection against transfected CHO cells expressing the GPID alpha component of the GPID/IX/V complex on their surface, followed by a 4th round of selection against washed human platelets, and 2 final rounds in which attempts were made to displace scFv from washed platelets by flooding with murine monoclonal antibody or mimotope peptide (see ANY95229). Whether displayed as surface proteins on a phagemid or secreted as free scFv by Bscherichia coli, the HID scFv clones are capable of inhibiting von Willebrand factor-dependent aggregation of platelets. The scFv are composed of native human protein sequences and are therefore attractive potential reagents for therapeutic purposes. They provide a new class of antithrombotic agents, useful for the prevention of platelet-dependent thrombi in diseased arteries, bypass created and also be used as diagnostic reagents. Methods of inhibiting aggregation of platelets, of binding human platelet chibbits platelet aggregation are claimed in indiseased arteries inhibits platelet aggregation are claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

                                                                                                                                                                                                                                                                                                                            line present sequence is chart.

Inter peptide of human single chain antibody (scFV) HID-5, which is directed against platelet glycoprotein ID (GPID). HID-5 is composed of a directed against platelet glycoprotein ID (GPID). HID-5 is composed of a vector-derived peptide linker. The HID series of scFv was isolated from a human synthetic VH and VL scFv library by 3 rounds of phagemid selection chainst transfected CHO cells expressing the GPID alpha component of the GPID/IXV complex on their surface, followed by a 4th round of selection against transfected CHO cells expressing the GPID alpha component of the GPID/IXV complex on their surface, followed by a 4th round of selection against transfected CHO cells expressing the GPID alpha component of the GPID/IXV complex on mimotope peptide (see ANY95229). Matcher displayed as surface proteins on a phagemid or secreted as free scFv by Escherichia coli, the HID scFv clones are capable of inhibiting von Willebrand factor-dependent aggregation of platelets. The scFv are composed of native charapeutic purposes. They provide a new class of antithrombotic agents, useful for the prevention of platelet-dependent thrombi in diseased arteries, bypass grafts, dialysis etc., and can also be used as diagnostic reagents. Methods of inhibiting aggregation of platelets, of binding human platelet GPID alpha and of selecting a VH or VL region of an antibody that inhibits platelet aggregation are claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

```
The invention comprises a human monoclonal antibody that binds to phospholipase A2 (PLA2). The monoclonal antibody of the invention is useful in the preparation of a medicament for the treatment of inflammatory and degenerative disorders stemming from inflammatory reactions in the joints, skin, and blood vessels, arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, and restenosis. The present amino acid sequence represents the light chain from a monoclonal antibody that is specific for the human phospholipase A2 (PLA2) enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human monoclonal antibody that binds to phospholipase A2 (PLA2), useful for treating inflammatory conditions, e.g. arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, or restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 DIVMTQSPLSLPVTPGEPASISCRSSQSLLHSNGYNYLDWYLQKPGQSPQLLIYLGSNRA

Ig kappa chain V region (V607) - human
C;Species: Homo sapiens (man)
C;Date: 22-Nov-1993 #sequence revision 10-Nov-1995 #text change 20-Jun-2000
C;Accession: S26882
R; Weichhold, G.M.; Klobeck, H.G.; Ohnheiser, R.; Combriato, G.; Zachau, H.G.
Nature 347, 90-92, 1990
A; Title: Megabase inversions in the human genome as physiological events.
A; Reference number: S26882; MUID: 90370099; PMID: 2118596
A;Accession: S26882
A;Status: preliminary; translation not shown
A; Molecule type: DNA
A;Residues: 1-132 <wei></wei>
A; Cross-references: UNIPARC: UP10000116D46; EMBL: X54248; NID: 937626; PIDN: CAA3
C;Genetics:
A;Introns: 17/1
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C: Keywords: heterotetramer; immunoglobulin

C; Keywords: heterotetramer; immunoglobulin F;36-115/Domain: immunoglobulin homology <IMM>
